

INSTALLATION GUIDE

AIS PILOT PLUG PINOUT

(VERSION 1.00, AUGUST 2015)

TRANSAS

1. INTRODUCTION

This instruction describes pinout of the **AIS Pilot Plug** on both sides: AIS Class A transponder and Pilot Plug clients (*AIS Wi-Fi Routers or Pilot Plug USB cable for laptops*).

2. AIS CLASS A 'PILOT PLUG' PINOUT

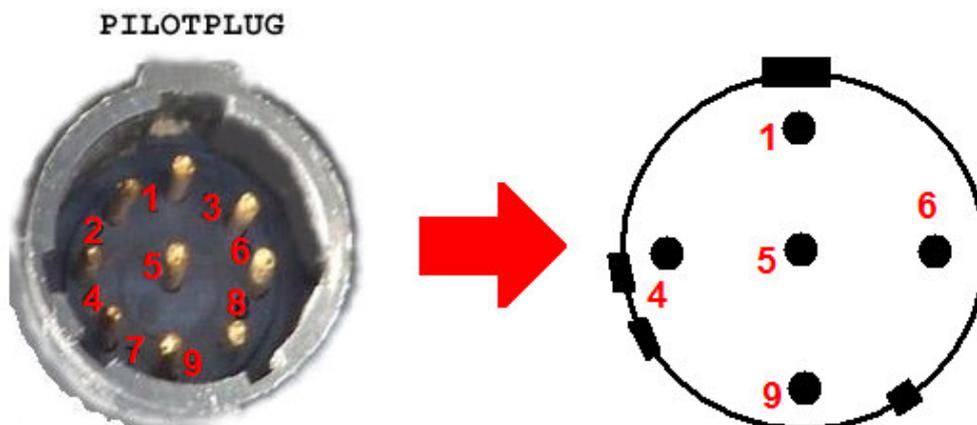

AIS Class A Pilot Plug could be available onboard via dedicated AMP "Male" connector on the AIS MKD:

or via wired Pilot Plug AMP "Male" connector at the Pilot operation place:

AIS Class A Pilot Plug Pinout, AMP Male connector:

Pilot Plug AMP Male (view to the connector):

Pin 1 - TxA – Grey

Pin 4 - TxB – Red

Pin 5 - RxA – Black

Pin 6 - RxB – Yellow

PS: colors may vary

2. CLIENT 'PILOT PLUG' SIDE PINOUT

The Pilot Plug client side connector could be following:

- AIS Pilot Plug Wi-Fi interface adapter:

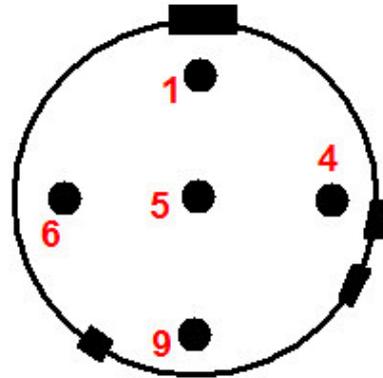

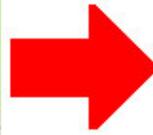

- Pilot Plug – USB cable for connections to laptop:

AIS Class A Pilot Plug Pinout, AMP Female connector:

Pilot Plug client cable

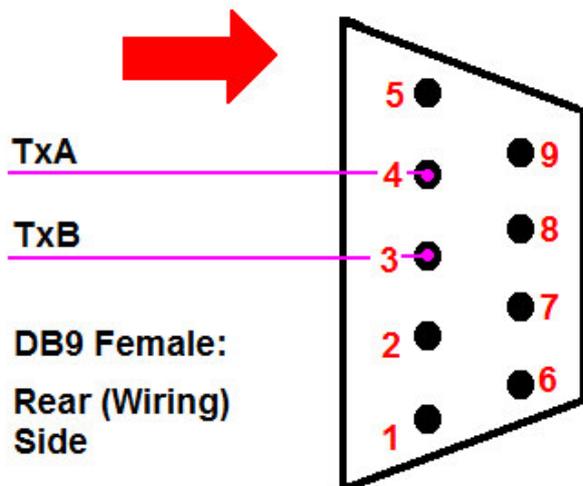

Pilot Plug AMP Female (view to connector):

- Pin 1 - TxA – Yellow
- Pin 4 - TxB – Green
- Pin 5 - RxA – Orange
- Pin 6 - RxB – Brown

PS: colors may vary

4. USING THE PILOT PLUG

- Connect the **Pilot Plug AIS Wi-Fi's** lead to the Pilot Plug on the AIS Class A Transponder (see image of a typical Pilot Plug). NOTE: On some installations, the Pilot Plug socket maybe mounted on the transponders connection box or attached to a panel close to the AIS Class A.
- Set the **Pilot Plug AIS Wi-Fi Interface** power switch to [ON].

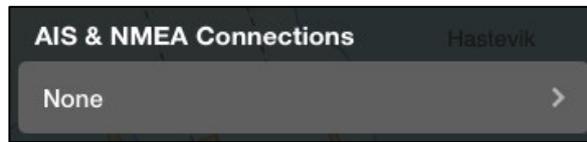

AIS Class A Pilot Plug

- To connect to **Pilot Plug AIS Wi-Fi Interface**, simply scan for wireless hotspots on your iPad and select connection to the corresponding SSID "**Transas-Pilot-XXXXX**" as shown on the example below:

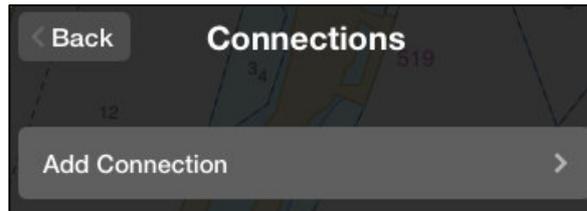

The **Pilot Pilot AIS Wi-Fi Interface** uses the TCP or UDP protocol to transmit serial NMEA data and **Transas Pilot PRO** app supports data reception via TCP or UDP protocol as well.

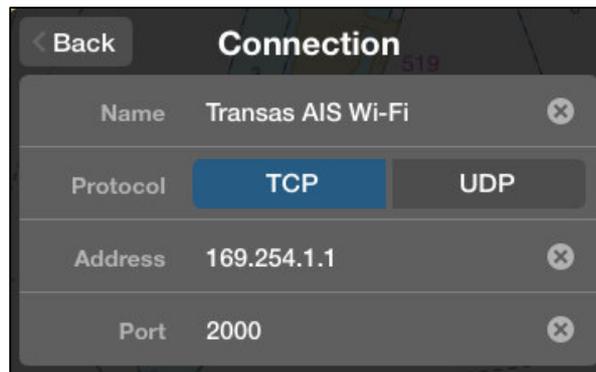

- Once you have wirelessly connected your mobile device to the **Transas Pilot AIS Wi-Fi Interface**, you will need to run the **Transas Pilot PRO** application on your iPad device and specify connection settings in the **“Settings” / “Sensors”** menu item (either TCP or UDP mode):

Tap on the arrow to create connection.

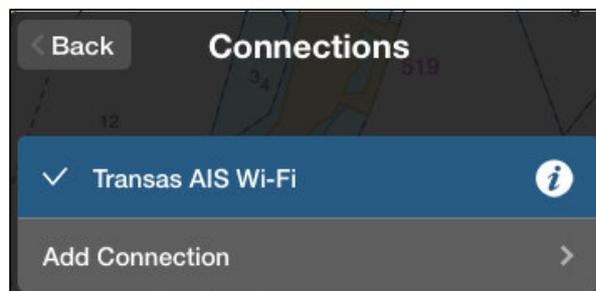

Tap on the arrow to Add new connection in the list.

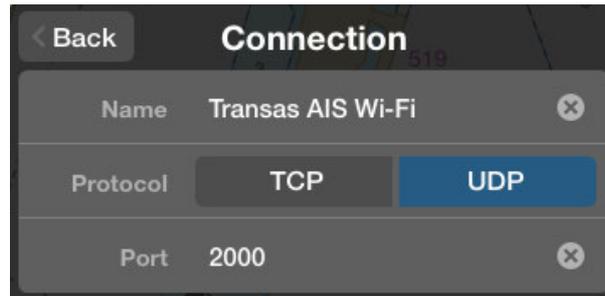

Create new connection.

For **TCP** you will need to enter Name of the connection, both the **IP Address** and **Port number**: as shown on example below for the **Transas Pilot AIS Wi-Fi** router and for **UDP** you just need the port number;

IP Address	-	169.254.1.1
Port	-	2000

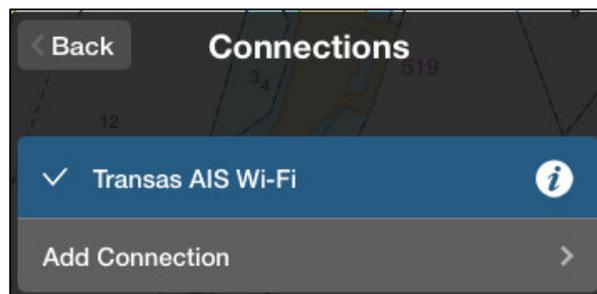

Tap [**Back**] button and check that your connection is established.

For **UDP** you just need the Name of the connection and Port number:

Port - **2000**

Tap [Back] button and check that your connection is established.

- You should now be able to receive the AIS Class A data wirelessly: Own ship data once per second (**VDO1,2,3** sentences – LAT/LON/COG/SOG and HDG & ROT (if available); or Targets data via **VDM** sentences, depends on their availability in the AIS VHF range.
